

Q: How do I use root motion?
OR the animation is looping in place, how do I fix it?

A: Uncheck “Bake into pose” in the animation settings and make sure “use root motion” is checked for the character.

A: You can adjust the settings as follows: check “bake into pose” for root transform rotation and root transform position (y). Uncheck it for Root Transform Position (XZ).

Q: How do I make the hands in the animation match up with my prop?

A: You can use an Inverse Kinematics control script. If this animation pack uses an IK script, a simple one will be included in the scripts folder. Apply this script to the character. Make an empty game object for each hand to grip. Select the empty game objects in the script drop down for each hand. You will need to position the empty game objects over your prop, including rotation, so that the hands appear to grasp the prop.

You can read more about IK in unity in the Unity manual here:
